RECORDS OF WELLS IN KINGS COUNTY, N. Y.

INTRODUCTION

In 1906 records of about 900 wells that had been drilled on Long Island were published in U. S. Geological Survey Professional Paper 44, "Underground water resources of Long Island, New York," by A. C. Veatch and others. Since that time a large number of wells have been drilled on the island, but no systematic attempt has been made to collect or preserve records of all these wells. Since 1932 the U. S. Geological Survey, in cooperation with the New York State Water Power and Control Commission and with Nassau and Suffolk Counties, has been carrying on an investigation of the ground-water conditions on Long Island. A part of this work has consisted of the collection and compilation of well records that were in the possession of waterworks officials, well-drilling companies, engineers, and others. It has of course not been feasible to attempt to obtain records of all wells that have been drilled since 1906, but an effort has been made to collect records of the more significant wells.

By the Laws of 1936, Chapter 839, the Legislature of the State of New York directed the Water Power and Control Commission to report upon the water supplies of Long Island. This was done on February 1, 1937, by publication of Bulletin GW-2, "Engineering Report on the Water Supplies of Long Island", by Russell Suter, Executive Engineer, submitted to the Legislature on February 25, 1937. During the course of this investigation records of many wells in Kings and Queens Counties were collected by consultants employed by the Water Power and Control Commission. Rather than publish these records by themselves as a supplement of Bulletin GW-2, it seemed desirable to combine them with similar records previously collected

by the U. S. Geological Survey. The well records from these two sources constitute a large amount of valuable data and it has seemed desirable to make them readily available to those interested. The compilation includes records of about 1,500 wells, which together with those published in Professional Paper 44 give information on about 2,500 wells.

Many of the wells have been abandoned or destroyed, but their records nevertheless indicate the conditions to be expected at the particular localities where they were drilled. Although some of the records are very incomplete, they at least give some information as to the conditions to be expected.

The present report includes only the records of wells drilled in Kings County (Brooklyn) - about 500 wells. Similar reports covering the other three Long Island counties are in preparation. As new wells are drilled the records will be collected and compiled and from time to time released for consultation by the public. Publication of the new records is contemplated when a sufficient number have been compiled.

The locations of wells for which logs are given in this report are shown on the map at the end of the report. It has not been possible to check in the field the locations of some of the wells. For such wells the locations as shown on the map are based either on the address given in the record and a street map of the county, or on information given by the driller, owner, or other person. To aid the reader in finding a well location, the map is divided into rectangles, which at the margins are lettered A, B, C, etc., from bottom to top and numbered 1, 2, 3, etc., from left to right. These coordinates are given in the heading of each well log as the first number and letter in parentheses. The other numbers

and letters in the parentheses indicate respectively the distance in miles north and west from the southeast corner of the rectangle in which the well is located. For example, well K 2, Rubel Ice Corporation, 18th and Cropsey Avenues, (1 B, 1.2 N., 0.3 W.), will be found on the map in the rectangle first from the left and second from the bottom, 1.2 miles north and 0.3 mile west of the southeast corner of the rectangle.

The well-numbering system used in this report is in general use by other workers on Long Island and has been adopted by the New York State Water Power and Control Commission. As a rule a single number has been assigned to each pumping plant, which may include several wells. In some instances, a separate number has been assigned to each well at one plant if the wells have individual pumps. Each number carries the first letter of the county name - K 1, K 2, etc. In general the numbers have been assigned in the order in which the records were collected. The numbers therefore have no geographic significance, because they were assigned at different times by different workers. A geographic order would of course be desirable, but this advantage would only be temporary, because wells drilled after the publication of this report could not be numbered according to such a system without unnecessarily complicating it. Many of the wells listed in the table of well data are not located on the map accompanying this report because this would have required a map so large as to make the cost prohibitive.

Most of the well records given in the table of well data were summarized from records of depth, diameter, capacity, etc., collected by Angus D. Henderson while employed by the New York State Water Power and Control Commission or from records collected by members of the United States Geological Survey. Records of wells that were listed in Professional Paper 44 are not given in the table of well data unless more recent or more complete data were obtained. Most of the well logs here given showing the thickness and nature of material penetrated were collected either by members of the United States Geological Survey or by J. Homer Sanford while employed by the New York State Water Power and Control Commission. Many of the logs were taken from an unpublished report by W. O. Crosby for the City of New York, Board of Water Supply, and a few additional records collected by him were furnished by Irving B. Crosby. The work of compiling and preparing the data for publication was done by the United States Geological Survey, with the assistance of George H. Clark and Virginia Del Vecchio, of the U. S. Works Progress Administration for the City of New York. The following members of the United States Geological Survey collected or compiled records included in this report: D. G. Thompson, F. G. Wells, Kyle Forrest, H. R. Blank, W. H. Monroe, R. M. Leggette, M. L. Brashears, and Meta H. Wendels. Most of the determinations of the chloride content of well waters given in the table of well data were made by the Mt. Prospect Laboratory of the City of New York, Department of Water Supply, Gas, and Electricity. Most of the measurements of ground-water temperature given in the table were made by the United States Geological Survey. Where the altitude of street level is given it is based on leveling by New York City. Acknowledgements are due to the many well-drilling companies, waterworks officials, engineers, and well owners, who with few exceptions willingly furnished information or made their records available. Without their cooperation this report would not have been possible.

Although footnotes have been used to briefly explain some of the data given in the table, further explanation seems desirable.

An industrial plant may have a number of wells on the property, each of which is designated by a number. These owner's numbers are shown in parentheses in the owner column in the table so that two or more wells listed under the same K number will not be confused.

The top of a well may be either above or below the land surface or street level. The depth as given in the table is in terms of street level, correction having been made for the distance between street level and the top of the well. A well may have originally been drilled considerably deeper than the depth at which the screen was finally set. The thickness of material penetrated as shown in the log may therefore be considerably greater than the depth of the well listed in the table. The bottom of the screen or perforated pipe was considered to be the bottom of the well for the purpose of reporting its depth.

Where two sizes are listed for diameter, the smaller size may be either the screen diameter, or the diameter of the smallest casing used. Where only one diameter is listed, larger casing may also have been used.

Most of the pump capacities listed in the table were obtained from driller's records. Where two or more wells are grouped together on one line in the table, the figures given for pump capacity and yield are the combined pump capacities or yields of all the wells listed on that line.

The yield of a well at the present time may be somewhat less than the yield listed in the table. The figures given in the table, are in most instances, reports based on pumping tests that were run when the wells were first constructed.

The figures given in the table for water level doubtless represent levels somewhat below the true static level in some instances because of the effect of nearby pumping wells or previous pumping in the well itself. The date of measurement of water level, if known, is given in the parentheses below the figures for the water level.

The salinity of water from the wells is indicated by the figures given in the table for chloride content. The date on which the water sample was collected is given in parentheses below the figures for chloride.

In most instances the ground-water temperatures listed in the table were accurately observed by means of special thermometers submerged in insulated containers that had been filled with fresh samples of water taken from pumping wells. The date of observation is given in parentheses below the figures for temperature.

Water level, chloride, and temperature data have been obtained periodically for many of the wells listed in the table. This additional information may be consulted in the Jamaica Office of the U. S. Geological Survey.

In the index of wells by owners an attempt has been made to list the wells under the names of former owners as well as the present owners. In the index of wells by streets, most of the wells have been listed under at least two streets. If a well is near the intersection of two streets it will generally be listed under both streets.

Copies of this report may be consulted at most of the libraries on Long Island and in metropolitan New York.

K 541. (1 B, 2.8 N., 0.7 W.). Drilled in 1916. Altitude of street about 90 feet above sea level. Record collected by W. O. Crosby.

						Thickness (feet)	Depth (feet.)
Clay, red, gravelly Gravel, fine, water-bearing.						74 46	7 4 120

There are 9 6-inch wells, 120 to 150 feet deep, and 6 10-inch wells 300 feet deep on this property. Chloride, 15 parts per million in 1916; 43 parts per million in September 1917. Hardness, 155 parts per million. The pumping stations are now abandoned.

K 543. (3 C, 1.2 N., 2.7 W.). Test well 5, New Ridgewood Reservoir. Drilled by Brooklyn Water Department in 1895. Altitude about 61 feet above sea level. An abbreviated log of this well is given in U. S. Geological Survey Professional Paper 44, page 191. The following record is furnished by the present owner.

	Thickness (feet)	Depth (feet)
Top soil	16 24	16 40
Sand, fine, yellow	11	51
Gravel, coarse	11	62
Gravel	26	88
Sand, sharp, gray	43	· 131
Gravel, brown, and sand	62	193
Clay, blue, with traces of decayed wood	7	200
Sand, dark gray	16	216
Clay, blue	64	280
Sand, black	4	284

The following log, by W. O. Crosby, appears to be based on his study of samples from well 5.

r	hickness (feet)	Depth (feet)
Sand, brown and gray, and gravel	35 12 33	35 47 80
Sand, coarse, gray, and fine gravel, fragments of oyster shells	2 6 1	82 88 89
Sand, coarse, yellow, and facetted stones Clay, blue, and gray with trace of lignite	5 3	9 4 97
